

The film placed on Youtube by Jean-Michel Tanac, of objects apparently moving around Luna, taken from a location in France, show an interesting feature, which would have been difficult to insert if it was modified by CGI.

All three objects show some type of flare, in front of them, as they move from sunlight into the darkness of the terminator's edge. Below are some screenshots of an analysis. The flares move with the objects.

[Flare in front of top two objects]
